

MOTHS do not eat clothes, yet their worms do. Moths are attracted to low levels of arsenic, yet high levels will kill them. Thus mothballs, containing arsenic, draw moths when their intensity tapers off, creating the faithful mothball customer. Mothball smell, highly toxic to humans, lasts a long time and is attached to items that have been placed with mothballs; even when most people cannot smell it: the moths can.

EXPERIENCE A woman had washed her sheets over decades, but their mothball smell was still attracting moths, and not allowing her high blood pressure to normalize. After washing the sheets with a few drops of Clorox (Eau de Javelle) added to the water, her blood pressure went down. A healthy, effective way to get rid of moths is using lavender blossoms in cotton cloth, placed in drawers and closets. When there are moths in a house, there are low level but toxic arsenic fumes (clothing, candles, cigarette smoke), affecting the full house. Arsenic may cause cancer (see book).

INSECTS are important in nature, each supporting nature's balance. We honor their tasks by letting them live but telling them NO in our home. How is it done?

FLIES do not like the scent of cloves. An orange can be densely poked with clove buds and hung by windows or doors. The orange keeps the clove buds moist and scenting, and the clove buds preserve the orange. Please forgive the little fly "that my ignore what other flies abhor."

SPIDERS are high frequency insects (cool) and need warmth. Indigo blue bottles placed in all windows makes spiders uncomfortable (orig. research). A few spiders may show but mainly at night.

EXPERIENCE With an indigo light, after reaction time, a spider moved across a wall, back and forth.

MOSQUITOES AND FLEES cannot stand citronella essential oil. Fill a pump spray bottle with water, add a few drops of citronella, shake well and spray in the air and on the skin. Also noseemus (tiny insects with inflammatory stings) are repelled by the spray, only all the skin has to be sprayed to which they have access. Repeat as needed.

Since 1997, New Earth Foundation, a nonprofit organization, has given many notable grants to nonprofit, cutting edge projects that serve to improve life in many communities. Please see the examples on [New Earth Foundation's](http://www.newearthfoundation.org) Sedona website, with its slide show and stunning earth images. In each grant cycle [New Earth Foundation](http://www.newearthfoundation.org) receives more requests for remarkable projects than it can grant! Here is where you can significantly help with your kind, tax deductible donations. It is easy to make your donations via credit card, check, money order or PayPal directly on [New Earth Foundation's](http://www.newearthfoundation.org) website. Thank you!

SCORPIONS can live in many climates. The extra eyes on their belly (assumable sensors) made them holy in ancient Egypt, as symbols of the biblical "Single Eye" (Matthew 6:22). Scorpions avoid crossing fuzzy areas like felt, hemp string or Velcro (these tickle their eyes and keep them laughing) – just joking). They cannot climb smooth materials and thus can be found in sinks in search of water, but not living in pipes. Their house entrance can be hindered by placing fuzzy or smooth items around windows and doors. They do not attack, but may sting when in danger. Placing the wound on an electric camera (some use a car battery) has quickly broken up the poison. Every emergency center could have such a camera (also for snake bites).

STINGS & BITES, when minor, have been treated with Tissue Salts: Nat. Mur., mixed with saliva or water, gently rubbed in; Ferr. Phos. when inflamed.

BOOK *The Scorpion Book*, www.NewAncientSecrets.com

ANTS AND COCKROACHES Without ants chewing the empty beetle shells, the earth might be covered by the shells. Ants also eat hair and other items that do not decay easily. Contrary to belief, cockroaches keep themselves very clean and likewise help to clean the earth by eating decaying items, e.g. rancid oils in soiled kitchens and bathrooms, mainly liking old fish and meat morsels and smells. Both, cockroaches and ants do not like the clean scent of peppermint: it is not their task. A pump spray bottle with water and a few drops of such essential oil, when shaken and sprayed on counters, thresholds and on window sills where they may come in, will signal to them: no task here, guys.

EXPERIENCE At first every day, a woman used peppermint/water spray for cockroaches, then every week or as needed. After some months doing so, her house was free of cockroaches.
